

High-Precision 3D Visualization and Technical Renders

Development of digital mockups and hyper-realistic textures for the construction industry

Product Line Presentation: Facade Systems and Thermal-Acoustic Insulation
Transformation of engineering specifications into strategic visual content. This project demonstrates the creation of renders for the B2B market, focused on highlighting internal structure, technical joints, material textures — such as bricks, foams, and finishes — and the exact dimensions of each component. Ideal for commercial catalogs and presentations for architects or construction companies.

01. Structure and Joint Detailing. Rendering focused on the visual demonstration of the assembly system. The model highlights the wall cross-section, revealing the precise fitting of the panels, the insulation layers, and the technical fixation of the cladding panels.

02. Texture and Finish Catalog. Clean presentation of product variations for catalog use. Focus on the hyper-realism of exposed brick textures, grout depth, and color accuracy, allowing the final client to understand the finish without the need for a physical sample.

03. Technical Render with Infographics and Dimensions. Integration between the 3D model and engineering specifications. Volumetric demonstration of corner elements and architectural trims with measurement markings in millimeters, ideal for installation manuals and technical datasheets.

04. Macro Material and Porosity Analysis. Macroscopic rendering for displaying the physical properties of insulating materials. The render captures the porosity of foams, the roughness of surfaces, and circular samples of mineral and cement-based textures with extreme precision.
